Answers to all the questions, along with the laboratory session in this course. Covering all the major body systems and their diseases. Answer to the first question asked in the first section for the 8th edition, which was. How many bones are in the body?

This question requires no knowledge of bone numbers. The number of bones in the body is 28. Although there are bones in other body parts, it is not necessary to know the answer to this question. According to the textbook, the number of bones in the

body is 28. It is said that bones are necessary for the development of the skeleton and the proper functioning of the organs, including the brain and the nervous system. The body forms bones to provide a framework that supports the various organs and to protect and support the vital organs. Bones are classified according to how they are organized, where they are located, their function, the kind of tissue they are made of, and what they are used for. Bones are classified as: 1. Skeletal or bony 2. Vertebral or spinal 3. Haversian or osseous 4. Cartilaginous 5. Neural 6. Fibrous 7. Ossified 8. Medullary 9. Remains of former bones 3-8

Many bones have a special name to indicate their location in the body or their function. A common name for bones is joint. The term is from the Latin word articulus meaning a joint. A joint is a connection between bones. Depending on the location of the joint, bones are named differently. When bones are connected by joints they are also called articulations. Bones that are free, such as fingers and toes, are also called articulations. Bones with a moveable or articulating joint are called cartilaginous bones. The types of bones are: skeleton The osseous components of the skeleton can be divided into: 1. Primary 2. Secondary 3. Post-natal 4. Growth 5. Remains of former bones The vertebral or spinal (intervertebral) joints are those that exist between the spinal vertebrae. The vertebral joints have three parts, an articulating, a synovial, and a costar cartilage. The synovial cavity contains synovial fluid. The articulating surfaces of the vertebral joints are covered with articular cartilage. The articular cartilage is covered with periosteum, which is an extension of bone that helps protect the cartilage. The space between the vertebra
